GATEKEEPERD / MCP

Gatekeeperd MCP

Manage projects and VPS operations from a conversational AI client.

IBM BOB × MODEL CONTEXT PROTOCOL

One connection.

Natural-language requests
Defined MCP tools
Gatekeeperd executes

THE PROBLEM

VPS administration is split across separate windows

A routine client task can cross project, billing, deployment and host controls.

01

Projects

Ownership and status

02

Payments

Balances and due dates

03

Deployments

Release state

04

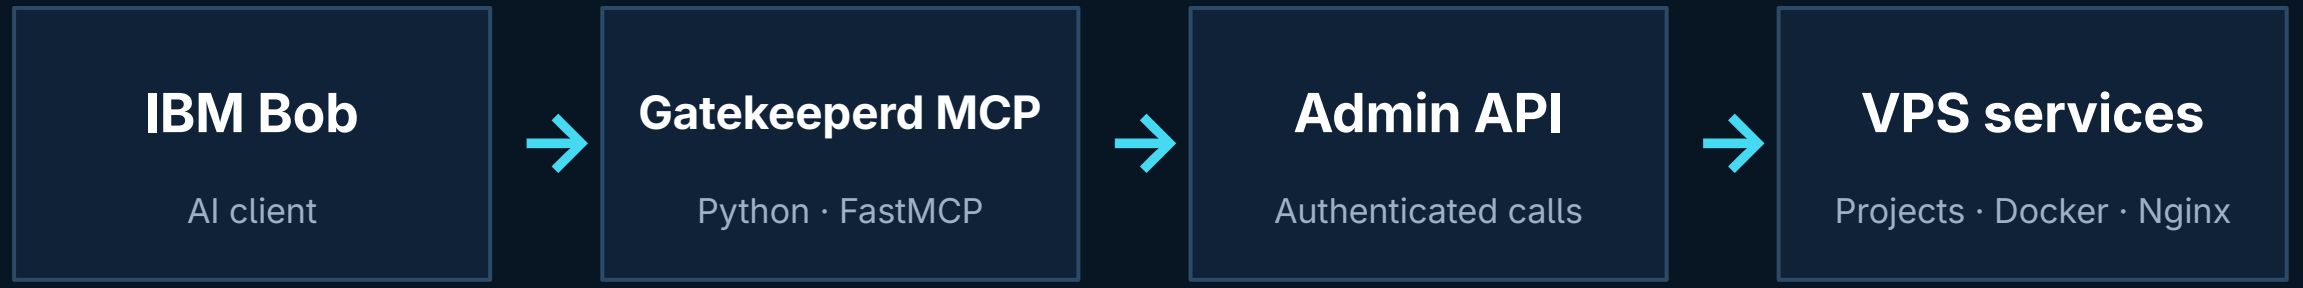

VPS services

Containers and Nginx

Gatekeeperd MCP gives the assistant one defined path into these admin functions.

One MCP connection, defined admin tools

Bob turns a request into a tool call; Gatekeeperd handles the operation.

READ

Projects · balances · container status · audit history

CHANGE

Block projects · control containers · deploy · manage Nginx and SSL

The demo shows Bob requesting approval before applying a project block.

The demo workflow

A single Bob conversation moves from account context to VPS status.

01	**List projects**	Project status and ownership are returned in the conversation.
02	**Check balances**	The assistant surfaces the project with an outstanding balance.
03	**Approve a block**	Bob asks for approval before the project action runs.
04	**Inspect containers**	The inventory includes state, ports, uptime and network.

Ask in plain language. Review the result. Continue from the same workspace.

One server, ten admin domains

87

registered MCP tools

COVERED BY THE SERVER

Projects · Customers · Payments · Invoices
Deployments · Containers · Nginx · Audit
System · Authentication

CONNECTION OPTIONS

Local stdio for Bob · API-key protected HTTP/SSE · OAuth 2.0 PKCE over Streamable HTTP

Built for developers and operators managing web projects on VPS infrastructure.
